- **Project Customizations**:

    - Ability to customize Notification Templates. Read more

    - Manage Configuration Tables. Read more

- **Incident Fixes**

    - A list of incidents fixed in this release. Read more
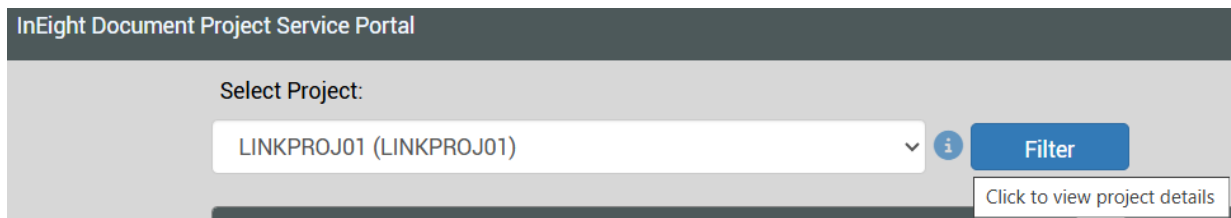

Project Options

Enable Additional Project Options (beta).

With this release we have introduced additional project settings that can now be set via the Project Service Portal and would not need to be sent over to be enabled by Dev.

    (a) Ability to enable Redline comment carry forward.
    (b) Ability to enable drop down caption format (Code – Title, Title Code)
    (c) Ability to define the Maximum Defect Ranks
    (d) Ability to Assign documents to the current standard folder during upload

Ability to view the Project Details.

A frequent request from Support and Project Delivery team members is to obtain details of a project, when it was created, what project was it based on, its GAB link settings etc. Now this can be obtained from the Project Service Portal.

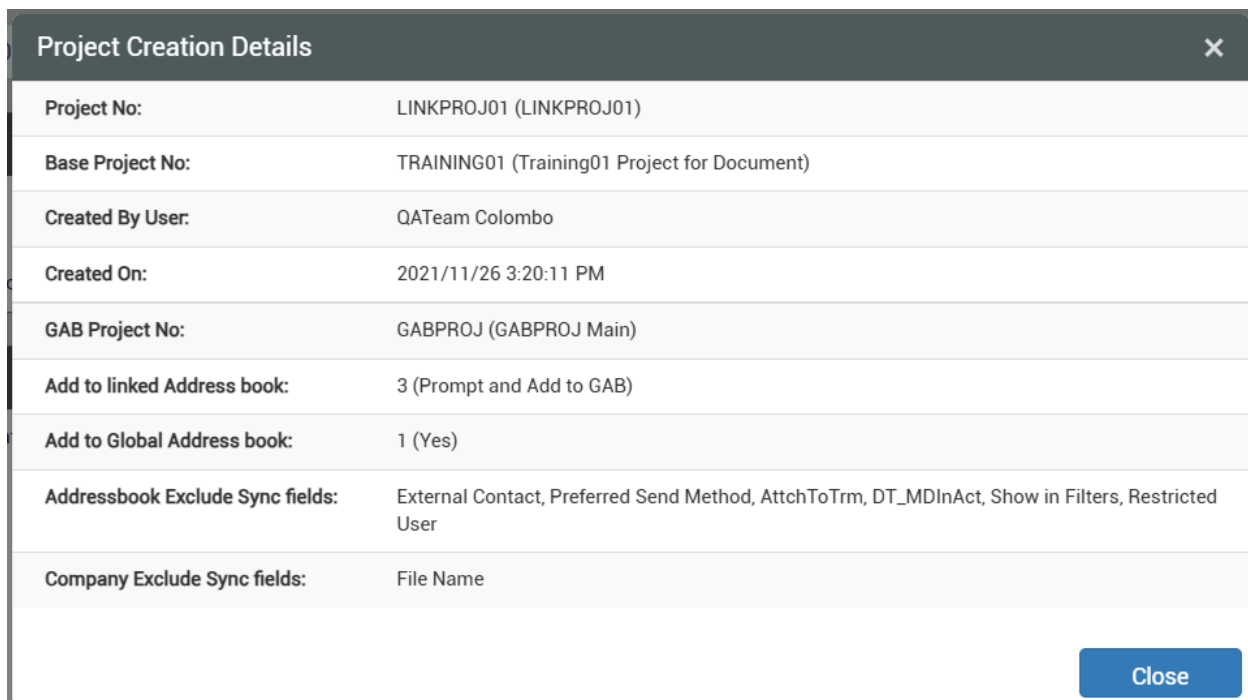

Clicking on the information icon next to the Project will bring up and show the following details.

Ability to access the Latest Release Notes.

You can now access the latest release notes for Project Service Portal from the portal itself. There is a new Help menu available, and you can download and view the release notes from there.

In a future release we will enhance this to have an archive of the past release notes as well and accessible all from one place.
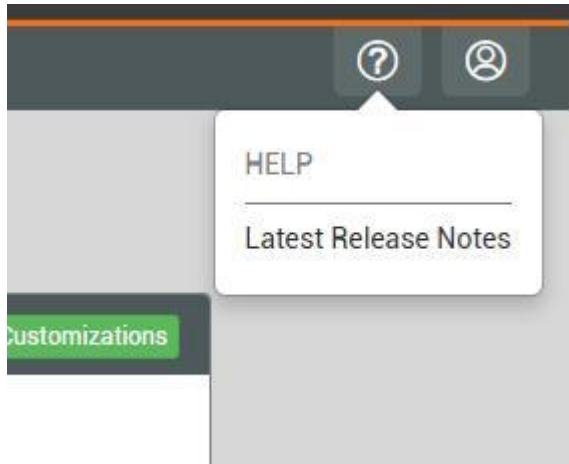

Ability to access Enable Modules in view/read only mode.

Users who currently do not have access to the Enable Modules screen, will now be able to access this and see what modules and options have been enabled for a project. The screen will be in a view/read only mode and not allow them to change any settings.
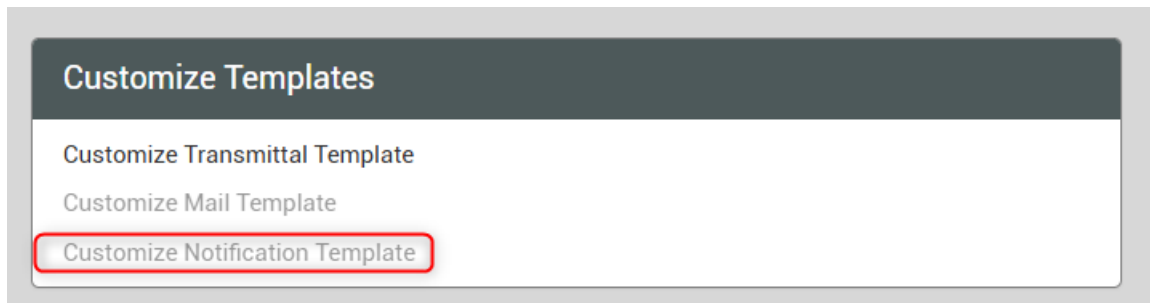

Project Customizations

Ability to Customize Notification Templates

With this release you now have the ability to customize Notification Templates on a project.

Note: This will not be enabled for projects by default and can be requested via a CST.

When the option is enabled on the project, you will see it under the "Customize Templates" option.

Clicking on this option will take you to the Notification Template Builder screen. You will need to first select a module and then the notification related to that module.

E.g. With the initial release the following notification templates will be available for modification

Notification of Un-restrained Document Upload under Document module.

Notification of New Mail under Mail module.

Notification of Form Issue under Form module.

We will keep adding the other notifications going forward with upcoming releases.

Similar to Transmittal & Mail Template editor, you are provided the following functionality.

- Customize the Notification Template Header and Body area, by adding / removing required standard and custom fields related to the notification based on the module its related to.

Ability to Manage Configuration Tables

With this release we have provide the ability to manage configuration tables all in one screen. You can create new, copy, define config table dependencies and remove configuration tables, all from one screen. Also, we have provided the new functionality to be able to alter the code and title lengths as well.

Incident Fixes

The following list of incidents have been checked and fixed in this release of the portal.

Incident	Subject	Raised By
INC0107809	Project Options - Disable or Gray Out options that cannot be enabled on Classic Projects using the PSP	Moraj Meegalla
